# Singular Value Decomposition (SVD)

Singular Valued Decomposition, SVD, general linear maps

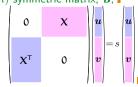

Adam Prügel-Bennet

COMP6208 Advanced Machine Learn

https://ecs-vlc.github.io/comp6208/

# Singular Valued Decomposition

• Consider an arbitrary  $n \times m$  matrix  $\mathbf{X}$ , and construct the  $(n+m) \times (n+m)$  symmetric matrix,  $\mathbf{B}$ ,  $\blacksquare$ 

- $\binom{u}{v}$  is an eigenvector of B with eigenvalue s
- We observe that

$$\mathbf{X} \mathbf{v} = s \mathbf{u}$$
  $\mathbf{X}^\mathsf{T} \mathbf{X} \mathbf{v} = s \mathbf{X}^\mathsf{T} \mathbf{u} \mathbf{l} = s^2 \mathbf{v} \mathbf{l}$ 

$$\mathbf{X}^{\mathsf{T}} \mathbf{u} = s \mathbf{v} \mathbf{I}$$
$$\mathbf{X} \mathbf{X}^{\mathsf{T}} \mathbf{u} = s \mathbf{X} \mathbf{v} \mathbf{I} = s^{2} \mathbf{u}$$

Adam Prügel-Bennett

COMP6208 Advanced Machine Learnin

https://ecs-vlc.github.io/comp6208/

#### **Matrix Decomposition**

• Stacking the eigenvectors into a matrix

- $\bullet$  Since the vectors  $\binom{u_i}{v_i}$  are eigenvectors of a symmetric matrix they from an orthogonal matrix if they are normalised.
- Multiply on the right by the transpose of the orthogonal matrix

Adam Prügel-Bennet

COMP6208 Advanced Machine Learning

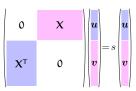

https://ecs-vlc.github.io/comp6208/

# SVD

- Any matrix, X, can be written as  $X = USV^T$ 
  - $\star~U,~V$  are orthogonal matrices
  - $\star S = \operatorname{diag}(s_1, s_2, \dots, s_n)$
- $s_i$  can always be chosen to be positive and are known as **singular** values
- Singular value decomposition applies to both square and non-square matrices—they describe general linear mappings

# **Outline**

- 1. Singular Value Decomposition
- 2. General Linear Mappings
- 3. Linear Regression Revisited

Adam Priigel-Bennett

OMP6208 Advanced Machine Learnin

https://ecs-vlc.github.io/comp6208/

### Eigenvectors

ullet Note that as  $\mathbf{X}oldsymbol{v} = soldsymbol{u}$  and  $\mathbf{X}^\mathsf{T}oldsymbol{u} = soldsymbol{v}$  then

$$\mathbf{X}(-\mathbf{v}) = (-s)\mathbf{u}$$
  $\mathbf{X}^{\mathsf{T}}\mathbf{u} = (-s)(-\mathbf{v})$ 

if  $\binom{u}{v}$  is an eigenvector of B with eigenvalue s then so is  $\binom{u}{-v}$  with eigenvalue  $-s \mathbf{I}$ 

- If n < m then  $X^TX$  is not full rank so some eigenvalues are zerol
- ullet As a consequence m-n vectors exist such that  $oldsymbol{X}oldsymbol{v}=0$
- The eigenvalues and eigenvectors are

$$n \times \left(s_i, \begin{pmatrix} \boldsymbol{u}_i \\ \boldsymbol{v}_i \end{pmatrix}\right) \quad n \times \left(-s_i, \begin{pmatrix} \boldsymbol{u}_i \\ -\boldsymbol{v}_i \end{pmatrix}\right) \quad m - n \times \left(0, \begin{pmatrix} 0 \\ \boldsymbol{v}_k \end{pmatrix}\right) \blacksquare$$

Adam Prügel-Bennett

COMP6208 Advanced Machine Learning

https://ecs-vlc.github.io/comp6208/

# **Normalisation Subtlety**

• Multiplying out we have

$$X = 2USV^T$$

$$X^T = 2VSU^T$$

ullet Now the vectors  $oldsymbol{u}_i$  and  $oldsymbol{v}_i$  form an orthogonal set as it satisfy

$$\mathbf{X}^\mathsf{T}\mathbf{X}\boldsymbol{v} = s^2\boldsymbol{v}$$

$$\mathbf{X}\mathbf{X}^{\mathsf{T}}\mathbf{u} = s^2\mathbf{u}$$

• But they are not normalised (since  $\binom{u_i}{v_i}$  is normalised). If we define  $\tilde{\mathbf{U}}=\sqrt{2}\mathbf{U}$  and  $\tilde{\mathbf{V}}=\sqrt{2}\mathbf{V}$  we find

$$X = \tilde{U} \, S \, \tilde{V}^\mathsf{T}$$

 $\mathbf{X}^\mathsf{T} = \tilde{\mathbf{V}} \mathbf{S} \tilde{\mathbf{U}}^\mathsf{T}$ 

Adam Prügel-Bennett

COMP6208 Advanced Machine Learning

https://ecs-vlc.github.io/comp6208/

# Finding SVD

- Most libraries will compute the SVD for you
- They can do this by choosing the smaller of two matrices XX<sup>T</sup> and X<sup>T</sup>X and then compute the eigenvalues
- The singular values are the square root of the eigenvalues (notice that XX<sup>T</sup> and X<sup>T</sup>X are both positive semi-definite so the eigenvalues will be non-negative)
- It can compute the  ${\bf U}$  matrix or  ${\bf V}$  matrix by multiplying through by  ${\bf X}$  or  ${\bf X}^{\sf T}$  ( ${\bf U}={\bf X}{\bf V}{\bf S}^{-1}$  and  ${\bf V}={\bf X}^{\sf T}{\bf U}{\bf S}^{-1}$ )
- In practice to perform PCA most people subtract the mean from their data and then perform SVD

# **Economical Forms of SVD**

• Often the rows or columns of the orthogonal matrices **U** and **V** that are not associated with a singular value are ignored

$$X = \mathbf{u} \quad \mathbf{s} \quad \mathbf{V}^{\mathsf{T}}$$
$$= \left( \begin{array}{c} \mathbf{0} \\ \mathbf{0} \end{array} \right) \left( \begin{array}{c} \mathbf{0} \\ \mathbf{0} \end{array} \right)$$

• In Matlab these are obtained using

>> [U, S, V] = svd(X) >> [U, S, V] = svd(X,'econ'))

Adam Prügel-Benne

COMP6208 Advanced Machine Learning

https://ecs-vlc.github.io/comp6208/

### **General Matrix**

- Recall that we can compute the SVD for any matrix, XI
- As matrices describe the most general linear mapping

$$oldsymbol{v} o \mathcal{T}[oldsymbol{v}] = oldsymbol{\mathsf{X}} oldsymbol{v}$$

- We can use SVD to understand any linear mapping
- Thus any linear mapping can be seen as a rotation followed by a squashing or expansion independently in each coordinate followed by another rotation.

dam Prügel-Bennett

COMP6208 Advanced Machine Learnin

https://ecs-vlc.github.io/comp6208/

#### **Determinants**

- ullet The determinant, |M| of a matrix M is defined for square matrices
- It describes the change in volume under the mapping
- Now for any two matrices |AB| = |A||B|
- Thus

$$|M| = |u||\textbf{S}||\textbf{V}^{\text{T}}|_{\blacksquare}$$

- $\bullet$  For and orthogonal matrix  $|\mathbf{U}|=\pm 1$
- Thus

$$|\mathbf{M}| = \pm |\mathbf{S}| = \pm \prod_{i} s_{i}$$

Adam Prügel-Bennett

COMP6208 Advanced Machine Learnin

https://ecs-vlc.github.io/comp6208/

### **Duality Revisited**

 $\bullet \ \, \text{If} \,\, X = USV^{\mathsf{T}} \,\, \text{then}$ 

$$\begin{split} C &= XX^\mathsf{T} & D &= X^\mathsf{T} X_{\!\! I} \\ &= U S V^\mathsf{T} V S^\mathsf{T} U^\mathsf{T} &= V S^\mathsf{T} U^\mathsf{T} U S V^\mathsf{T}_{\!\! I} \\ &= U (S S^\mathsf{T}) U^\mathsf{T} &= V (S^\mathsf{T} S) V^\mathsf{T}_{\!\! I} \end{split}$$

- If  ${\bf X}$  is an  $p \times m$  matrix then  ${\bf S}{\bf S}^{\sf T}$  is a  $p \times p$  diagonal matrix with elements  $S^2_{ii} = s^2_i {
  m I}$
- $\mathbf{S}^{\mathsf{T}}\mathbf{S}$  is an  $m \times m$  matrix with elements  $S_{ii}^2 = s_i^2$
- $\bullet$   $\,U$  and  $\,V$  are matrices of eigenvectors for  $\,C$  and  $\,D\blacksquare$
- The eigenvalues are  $\lambda_i = S_{ii}^2 = s_i^2$

# Outline

- 1. Singular Value Decomposition
- 2. General Linear Mappings
- 3. Linear Regression Revisited

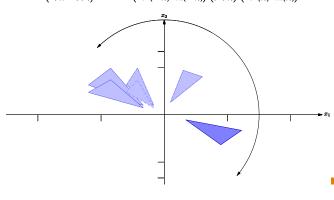

Adam Prügel-Bennett

OMP6208 Advanced Machine Learning

https://ecs-vlc.github.io/comp6208/

### **Matrices**

 $\mathbf{M} = \begin{pmatrix} -0.45 & 1.9 \\ -0.77 & -0.025 \end{pmatrix} = \mathbf{U} \, \mathbf{S} \, \mathbf{V}^\mathsf{T} = \begin{pmatrix} \cos(-175) & \sin(-175) \\ -\sin(-175) & \cos(-175) \end{pmatrix} \begin{pmatrix} 2 & 0 \\ 0 & 0.75 \end{pmatrix} \begin{pmatrix} \cos(75) & \sin(75) \\ -\sin(75) & \cos(75) \end{pmatrix}$ 

Adam Prügel-Bennet

COMP6208 Advanced Machine Learn

https://ecs-vlc.github.io/comp6208/

#### **Non-Square Matrices**

- When the matrices are non-square then the matrix of singular value matrix will either
  - ★ Squash some directions to zero
  - $\star$  Introduce new dimensions orthogonal to the vector

• The rank of an arbitrary matrix is the number of non-zero singular values (also number of linearly independent rows or columns)

Adam Prügel-Bennet

COMP6208 Advanced Machine Learni

https://ecs-vlc.github.io/comp6208/

## $SS^T$ and $S^TS$

$$\mathbf{S} = \begin{pmatrix} s_1 & 0 & \cdots & 0 & 0 & \cdots & 0 \\ 0 & s_2 & \cdots & 0 & 0 & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & s_m & 0 & 0 \cdots & 0 \end{pmatrix} \mathbf{I}$$

$$\mathbf{S}^\mathsf{T}\mathbf{S} = \begin{pmatrix} s_1^2 & 0 & \cdots & 0 & 0 & \cdots & 0 \\ 0 & s_2^2 & \cdots & 0 & 0 & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & s_m^2 & 0 & 0 \cdots & 0 \\ 0 & 0 & \cdots & 0 & 0 & 0 \cdots & 0 \\ \vdots & \vdots & \cdots & \vdots & \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & 0 & 0 & 0 \cdots & 0 \end{pmatrix}$$

$$\mathbf{S}\mathbf{S}^{\mathsf{T}} = \begin{pmatrix} s_1^2 & 0 & \cdots & 0 \\ 0 & s_2^2 & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & s^2 \end{pmatrix}$$

 $X^T$ 

• It's really easy to verify this in MATLAB or OCTAVE

>> X = rand(3,2) >> [U, S, V] = svd(X) >> U\*s\*V' >> U'\*U(:,1)'\*U(:,2) >> U'\*U' >> U\*U' >> [Ua,L] = eig(X\*X') >> S\*S'

• Test yourself!

......

COMP6208 Advanced Machine Learni

1. Singular Value Decomposition

3. Linear Regression Revisited

2. General Linear Mappings

https://ecs-vlc.github.io/comp6208/

### Linear Regression

- $\bullet$  Given a set of data  $\mathcal{D} = \{(\boldsymbol{x}_i, y_i) | k = 1, 2, \ldots, m\} \mathbb{I}$
- In linear regression we try to fit a linear model

$$f(\boldsymbol{x}|\boldsymbol{w}) = \boldsymbol{x}^\mathsf{T} \boldsymbol{w} \mathbf{I}$$

• Which we fit by minimising the squared error loss

$$L(\boldsymbol{w}) = \sum_{k=1}^{m} (f(\boldsymbol{x}_i|\boldsymbol{w}) - y_i)^2 \mathbf{I}$$

Adam Prügel-Bennett

COMP6208 Advanced Machine Learnin

https://ecs-vlc.github.io/comp6208/

### **Using SVD**

 $\bullet$  Using  $X = USV^\mathsf{T}$  then

$$\begin{split} X^+ &= \left(X^TX\right)^{-1}X^T \mathbf{I} \\ &= \left(VS^TSV^T\right)^{-1}VS^TU^T \mathbf{I} \\ &= V\left(S^TS\right)^{-1}V^TVS^TU^T \mathbf{I} \\ &= V\left(S^TS\right)^{-1}S^TU^T \mathbf{I} = VS^+U^T \mathbf{I} \end{split}$$

• If m > p

Adam Prügel-Bennett

COMP6208 Advanced Machine Learnin

https://ecs-vlc.github.io/comp6208/

#### **III-Conditioned Data Matrix**

• Recall that

$$w^* = X^+ y = V S^+ U^T y$$

- If any of the singular values of X are small then S<sup>+</sup> will magnify components in that direction
- ullet Any errors in the target y will be magnified
- This leads to poor weights

# Matrix Form

ullet In matrix from we write  $L(oldsymbol{w}) = \left\| oldsymbol{X} oldsymbol{w} - oldsymbol{y} 
ight\|^2$ 

$$\mathbf{X} = egin{pmatrix} oldsymbol{x}_1^{\intercal} \ oldsymbol{x}_2^{\intercal} \ oldsymbol{x}_m^{\intercal} \end{pmatrix}$$
  $oldsymbol{y} = egin{pmatrix} y_1 \ y_2, \ oldsymbol{y} \ y_m \end{pmatrix}$ 

• Then  $\nabla L(\boldsymbol{w}^*) = 0$  implies

$$\boldsymbol{w}^* = \left( \mathbf{X}^\mathsf{T} \mathbf{X} \right)^{-1} \mathbf{X}^\mathsf{T} \boldsymbol{y} = \mathbf{X}^+ \boldsymbol{y}$$

• This is known as the pseudo-inverse

Adam Prügel-Bennett

OMP6208 Advanced Machine Learning

https://ecs-vlc.github.io/comp6208/

## Pseudo-Inverse of S

$$\mathbf{S}^{\mathsf{T}}\mathbf{S} = \begin{pmatrix} s_1^2 & 0 & \cdots & 0 \\ 0 & s_2^2 & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & s_p^2 \end{pmatrix} \mathbf{I} \ \left(\mathbf{S}^{\mathsf{T}}\mathbf{S}\right)^{-1} = \begin{pmatrix} s_1^{-2} & 0 & \cdots & 0 \\ 0 & s_2^{-2} & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & s_p^{-2} \end{pmatrix} \mathbf{I}$$

$$\mathbf{S}^{+} = \left(\mathbf{S}^{\mathsf{T}}\mathbf{S}\right)^{-1}\mathbf{S}^{\mathsf{T}} \!\!\!\! = \begin{pmatrix} s_{1}^{-1} & 0 & 0 & \cdots & 0 & 0 & \cdots & 0 \\ 0 & s_{2}^{-1} & 0 & \cdots & 0 & 0 & \cdots & 0 \\ 0 & 0 & s_{3}^{-1} & \cdots & 0 & 0 & \cdots & 0 \\ \vdots & \vdots & \vdots & \ddots & \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & 0 & \cdots & s_{p}^{-1} & 0 & 0 & \cdots & 0 \end{pmatrix} \!\!\!\! - \!\!\!\! \mathbf{I}$$

Adam Prügel-Bennett

COMP6208 Advanced Machine Learnin

https://ecs-vlc.github.io/comp6208/

#### Regularisation

• Consider linear regression with a regulariser

$$\mathcal{L}(\boldsymbol{w}) = \|\mathbf{X}\boldsymbol{w} - \boldsymbol{y}\|^2 + \eta \|\boldsymbol{w}\|^2$$
$$= \boldsymbol{w}^{\mathsf{T}}(\mathbf{X}^{\mathsf{T}}\mathbf{X} + \eta \mathbf{I}) \boldsymbol{w} - 2\boldsymbol{w}^{\mathsf{T}}\mathbf{X}^{\mathsf{T}}\boldsymbol{y} + \boldsymbol{y}^{\mathsf{T}}\boldsymbol{y}^{\mathsf{T}}$$

Thus

$$\nabla \mathcal{L}(\boldsymbol{w}) = 2 \left( \mathbf{X}^\mathsf{T} \mathbf{X} + \eta \mathbf{I} \right) \boldsymbol{w} - 2 \mathbf{X}^\mathsf{T} \boldsymbol{y}$$

• and  $\nabla \mathcal{L}(\boldsymbol{w}^*) = 0$  gives

$$\boldsymbol{w}^* = \left( \mathbf{X}^\mathsf{T} \mathbf{X} + \eta \mathbf{I} \right)^{-1} \mathbf{X}^\mathsf{T} \boldsymbol{y}$$

# Regularisation Continued

 $\bullet \ \mathsf{Using} \ X = USV^\mathsf{T}$ 

$$egin{aligned} oldsymbol{w}^* &= \left( \mathbf{X}^\mathsf{T} \mathbf{X} + \eta \mathbf{I} \right)^{-1} \mathbf{X}^\mathsf{T} oldsymbol{y} \mathbf{I} \ &= \mathbf{V} \left( \mathbf{S}^\mathsf{T} \mathbf{S} + \eta \mathbf{I} \right)^{-1} \mathbf{S}^\mathsf{T} \mathbf{U}^\mathsf{T} oldsymbol{y} \mathbf{I} \end{aligned}$$

• where

$$\left(\mathbf{S}^\mathsf{T}\mathbf{S} + \eta\mathbf{I}\right)^{-1}\mathbf{S}^\mathsf{T} = \begin{pmatrix} \frac{s_1}{s_1^2+\eta} & 0 & 0 & \cdots & 0 & 0 & \cdots & 0 \\ 0 & \frac{s_2}{s_2^2+\eta} & 0 & \cdots & 0 & 0 & \cdots & 0 \\ 0 & 0 & \frac{s_3}{s_3^2+\eta} & \cdots & 0 & 0 & \cdots & 0 \\ \vdots & \vdots & \vdots & \ddots & \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & 0 & \cdots & \frac{s_p}{s_p^2+\eta} & 0 & 0 & \cdots & 0 \end{pmatrix}$$

Adam Prügel-Benne

COMP6208 Advanced Machine Learnin

https://ecs-vlc.github.io/comp6208/

#### Summary

- ullet Any matrix can be decomposed as  $X = USV^{\mathsf{T}}$  where
  - $\star$  U and V are orthogonal (rotation matrices)
  - $\star$   $\mathbf{S} = \mathrm{diag}(s_1, ..., s_n)$  is a diagonal matrix of positive singular values
- This describes the most general linear transform
- The transform exploits the duality between  $XX^T$  and  $X^TX$
- In linear regression the pseudo-inverse involves the reciprocal of the singular values, which can lead to poor generalisation.
- Regularisation improves the conditioning of the "inverse" matrix

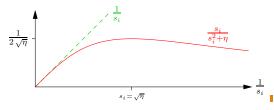

Adam Prügel-Bennett

COMP6208 Advanced Machine Learnin

https://ecs-vlc.github.io/comp6208

# Effect of Regularisation

- Without regularisation if  $s_i=0$  the problem would be ill-posed (even  $\mathbf{S}^+$  does not exist since  $s_i^{-1}$  would be ill defined) and if  $s_i$  is small then  $\mathbf{S}^+$  is ill conditioned
- $\bullet$  Using  $\hat{\mathbf{S}}^+ = (\mathbf{S}^\mathsf{T}\mathbf{S} + \eta)^{-1}\mathbf{S}^\mathsf{T}$  instead of  $\mathbf{S}^+$  then

 Regularisation makes the machine much more stable (reduces the variance)

Adam Prügel-Bennett

COMP6208 Advanced Machine Learnin

https://ecs-vlc.github.io/comp6208/
