COMP6208 Advanced Machine Learning

Eigenvector equation

- Eigen-systems help us to understand mappings
- ullet A vector v is said to be an **eigenvector** if

$$\mathbf{M} oldsymbol{v} = \lambda oldsymbol{v}$$

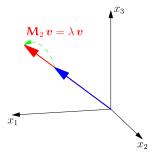

• M is square (i.e. $n \times n$)

Adam Prügel-Bennett

- \bullet Where the number λ is the ${\bf eigenvalueII}$
- Eigenvalues play a fundamental role in understanding operators

Outline

- 1. Eigenvectors
- 2. Orthogonal Matrices
- 3. Eigen Decomposition
- 4. Low Rank Approximation

Adam Prügel-Bennett

COMP6208 Advanced Machine Learning

Symmetric Matrices

- If M is an $n \times n$ symmetric matrix then it has n real orthogonal eigenvectors with real eigenvalues
- \bullet We denote the i^{th} eigenvector by \boldsymbol{v}_i and the corresponding eigenvalue by λ_i so that

$$\mathbf{M} \mathbf{v}_i = \lambda_i \mathbf{v}_i$$

ullet Orthogonal means that if $i \neq j$ then

$$\boldsymbol{v}_i^\mathsf{T} \boldsymbol{v}_i = 0$$

• (We can always normalise eigenvectors if we want)

COMP6208 Advanced Machine Learning

Adam Prügel-Bennett

COMP6208 Advanced Machine Learning

Proof of Orthogonality

- ullet $\left(\mathbf{M}oldsymbol{v}_i = \lambda_ioldsymbol{v}_i
 ight)^\mathsf{T}$ implies $oldsymbol{v}_i^\mathsf{T}\mathbf{M}^\mathsf{T} = \lambda_ioldsymbol{v}_i^\mathsf{T}$
- ullet When $oldsymbol{M}$ is symmetric then $oldsymbol{M} oldsymbol{v}_i = \lambda_i oldsymbol{v}_i^{\mathsf{T}} oldsymbol{M} = \lambda_i oldsymbol{v}_i^{\mathsf{T}}$
- ullet Consider two eigenvectors $oldsymbol{v}_i$ and $oldsymbol{v}_j$ of $oldsymbol{M}$

$$egin{aligned} oldsymbol{v}_i^\mathsf{T} \mathbf{M} oldsymbol{v}_j &= (oldsymbol{v}_i^\mathsf{T} \mathbf{M}) oldsymbol{v}_j &= \lambda_i oldsymbol{v}_i^\mathsf{T} oldsymbol{v}_j \\ &= oldsymbol{v}_i^\mathsf{T} (\mathbf{M} oldsymbol{v}_j) &= \lambda_j oldsymbol{v}_i^\mathsf{T} oldsymbol{v}_j \mathbf{I} \end{aligned}$$

- ullet So either $\lambda_i=\lambda_j$ or $oldsymbol{v}_i^{\mathsf{T}}oldsymbol{v}_j=0$
- If $\lambda_i=\lambda_j$ then any linear combination of \boldsymbol{v}_i and \boldsymbol{v}_j is an eigenvector $(\mathbf{M}(a\boldsymbol{v}_i+b\boldsymbol{v}_j)=\lambda_i(a\boldsymbol{v}_i+b\boldsymbol{v}_j))$. So I can choose two eigenvectors that are orthogonal to each other.

Adam Prügel-Bennett

Adam Prügel-Bennett

COMP6208 Advanced Machine Learning

Orthogonal Matrices

• We can construct an **orthogonal** matrix **V** from the eigenvectors

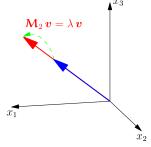

$$\mathbf{V} = (\boldsymbol{v}_1, \boldsymbol{v}_2, \cdots, \boldsymbol{v}_n)$$

- Matrix ${f V}$ is an $n{ imes}n$ matrix
- ullet Because of the orthogonality of the vectors $oldsymbol{v}_i$

$$\mathbf{V}^{\mathsf{T}}\mathbf{V} \mathbf{I} = \begin{pmatrix} \mathbf{v}_1^{\mathsf{T}} \mathbf{v}_1 & \mathbf{v}_1^{\mathsf{T}} \mathbf{v}_2 & \cdots & \mathbf{v}_1^{\mathsf{T}} \mathbf{v}_n \\ \mathbf{v}_2^{\mathsf{T}} \mathbf{v}_1 & \mathbf{v}_2^{\mathsf{T}} \mathbf{v}_2 & \cdots & \mathbf{v}_2^{\mathsf{T}} \mathbf{v}_n \\ \vdots & \vdots & \ddots & \vdots \\ \mathbf{v}_n^{\mathsf{T}} \mathbf{v}_1 & \mathbf{v}_n^{\mathsf{T}} \mathbf{v}_2 & \cdots & \mathbf{v}_n^{\mathsf{T}} \mathbf{v}_n \end{pmatrix} \mathbf{I} = \begin{pmatrix} 1 & 0 & \cdots & 0 \\ 0 & 1 & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & 1 \end{pmatrix} \mathbf{I} = \mathbf{I} \mathbf{I}$$

- 2. Orthogonal Matrices
- 3. Eigen Decomposition
- 4. Low Rank Approximation

Adam Prügel-Bennett

COMP6208 Advanced Machine Learning

The Other Way Around

- ullet We have shown that ${f V}^{\sf T}{f V}={f I}{llet}$
- \bullet Thus multiply both sides on the left by V

$$VV^{\mathsf{T}}V = V$$

- ullet ${f V}$ will have an inverse, ${f V}^{-1}$, such that ${f V}{f V}^{-1}={f I}$
- ullet Multiplying the equation on the right by ${f V}^{-1}$

$$\begin{aligned} (\boldsymbol{V}\boldsymbol{V}^{\mathsf{T}})\boldsymbol{V}\boldsymbol{V}^{-1} &= \boldsymbol{V}\boldsymbol{V}^{-1} \boldsymbol{\mathsf{I}} \\ \boldsymbol{V}\boldsymbol{V}^{\mathsf{T}} &= \boldsymbol{I}\boldsymbol{\mathsf{I}} \end{aligned}$$

ullet Note that, ${f V}^{-1}={f V}^{\sf T}$ (definition of orthogonal matrix)

Invertible Matrices

ullet A matrix, M, will be singular (uninvertible) if there exists a vector $x\ (
eq 0)$ such that

$$\mathbf{M}\mathbf{x} = \mathbf{0}$$

ullet Now if there exists such a vector such that ${f V} x=0$ then multiply by ${f V}^{\mathsf T}$ we get

$$\mathbf{V}^{\mathsf{T}}\mathbf{V}x=\mathbf{V}^{\mathsf{T}}\mathbf{0}$$
0 $x=\mathbf{0}$

since $\mathbf{V}^\mathsf{T}\mathbf{V} = \mathbf{I}_{\bullet}$

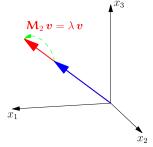

ullet Thus $oldsymbol{V}$ is invertible

COMP6208 Advanced Machine Learning

Outline

- 1. Eigenvectors
- 2. Orthogonal Matrices
- 3. Eigen Decomposition
- 4. Low Rank Approximation

Rotations

- ullet Orthogonal matrices satisfy $\mathbf{V}^\mathsf{T}\mathbf{V} = \mathbf{V}\mathbf{V}^\mathsf{T} = \mathbf{I}$
- As a consequent they define rotations (and possibly a reflection)
- ullet Consider a vector x and $x'=\mathbf{V}x$, now

$$\|\boldsymbol{x}'\|_2^2 = \boldsymbol{x}'^\mathsf{T} \boldsymbol{x}' \boldsymbol{\mathbb{I}} = (\mathbf{V}\boldsymbol{x})^\mathsf{T} (\mathbf{V}\boldsymbol{x}) \boldsymbol{\mathbb{I}} = \boldsymbol{x}^\mathsf{T} \mathbf{V}^\mathsf{T} \mathbf{V} \boldsymbol{x} \boldsymbol{\mathbb{I}} = \boldsymbol{x}^\mathsf{T} \boldsymbol{x} \boldsymbol{\mathbb{I}} = \|\boldsymbol{x}\|_2^2 \boldsymbol{\mathbb{I}}$$

ullet Similarly if additionally y'=Vy then

• Rotations and reflections preserve lengths and angles

Adam Prügel-Bennett

COMP6208 Advanced Machine Learnin,

Matrix Decomposition

ullet Taking the matrix of eigenvectors, V, then

$$\mathbf{MV} = \mathbf{M}(\mathbf{v}_1, \mathbf{v}_2, ..., \mathbf{v}_n) = (\lambda_1 \mathbf{v}_1, \lambda_2 \mathbf{v}_2, ..., \lambda_n \mathbf{v}_n) = \mathbf{V} \mathbf{\Lambda}$$

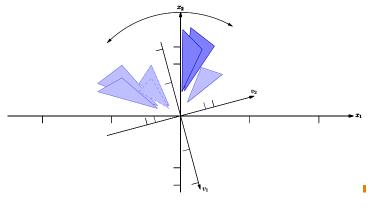

- $\bullet \text{ where } \pmb{\Lambda} = \operatorname{diag}(\lambda_1, \lambda_2, \ldots, \lambda_n) = \begin{pmatrix} \lambda_1 & 0 & \cdots & 0 \\ 0 & \lambda_2 & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & \lambda_n \end{pmatrix}$
- Now

$$M = MVV^{\mathsf{T}} = V\Lambda V^{\mathsf{T}}$$

• Very important *similarity transform*

Mappings by Symmetric Matrices

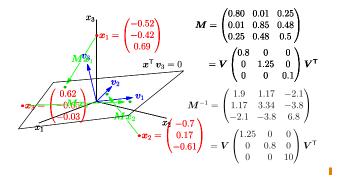

$$\mathbf{M} = \begin{pmatrix} 0.83 & -0.31 \\ -0.31 & 1.9 \end{pmatrix} = \mathbf{V}\mathbf{A}\mathbf{V}^\mathsf{T} = \begin{pmatrix} \cos(-75) & \sin(-75) \\ -\sin(-75) & \cos(-75) \end{pmatrix} \begin{pmatrix} 2 & 0 \\ 0 & 0.75 \end{pmatrix} \begin{pmatrix} \cos(75) & \sin(75) \\ -\sin(75) & \cos(75) \end{pmatrix}$$

Adam Prügel-Bennett

COMP6208 Advanced Machine Learning

III-Conditioning Again

Inverses

• For any square matrix

$$\mathbf{M} = \mathbf{V}\boldsymbol{\Lambda}\mathbf{V}^{\mathsf{T}} \mathbf{I} \qquad \qquad \mathbf{M}^{-1} = \mathbf{V}\boldsymbol{\Lambda}^{-1}\mathbf{V}$$

• Where
$$\mathbf{\Lambda}^{-1} = \operatorname{diag}(\frac{1}{\lambda_1}, \frac{1}{\lambda_2}, \dots, \frac{1}{\lambda_n}) = \begin{pmatrix} \frac{1}{\lambda_1} & 0 & \cdots & 0\\ 0 & \frac{1}{\lambda_2} & \cdots & 0\\ \vdots & \vdots & \ddots & \vdots\\ 0 & 0 & \cdots & \frac{1}{\lambda_n} \end{pmatrix}$$

Since

$$\begin{split} \boldsymbol{M} \boldsymbol{M}^{-1} &= (\boldsymbol{V} \boldsymbol{\Lambda} \boldsymbol{V}^{\mathsf{T}}) (\boldsymbol{V} \boldsymbol{\Lambda}^{-1} \boldsymbol{V}^{\mathsf{T}}) \boldsymbol{\mathbb{I}} = \boldsymbol{V} \boldsymbol{\Lambda} (\boldsymbol{V}^{\mathsf{T}} \boldsymbol{V}) \boldsymbol{\Lambda}^{-1} \boldsymbol{V}^{\mathsf{T}} \boldsymbol{\mathbb{I}} \\ &= \boldsymbol{V} \boldsymbol{\Lambda} \boldsymbol{\Lambda}^{-1} \boldsymbol{V}^{\mathsf{T}} \boldsymbol{\mathbb{I}} = \boldsymbol{V} \boldsymbol{V}^{\mathsf{T}} = \boldsymbol{\mathbb{I}} \boldsymbol{\mathbb{I}} \end{split}$$

• I.e, Small eigenvalues become large eigenvalues and visa versel

Adam Prügel-Bennett

COMP6208 Advanced Machine Learning

Condition Number

- Taking matrix inverses can be inherently unstable
- Any small error can be amplified by taking the inverse
- The stability of the inverse depends on the ratio of smallest eigenvalue to the largest eigenvalue (i.e. the biggest possible amplification compared to the smallest)
- Note that the Hilbert-norm of a matrix is the absolute value of the largest eigenvalue
- The condition number is given by

$$\|\mathbf{M}\|_H imes \|\mathbf{M}^{-1}\|_H = rac{|\lambda_{\mathsf{max}}|}{|\lambda_{\mathsf{min}}|}$$

• Large condition number implies very ill-conditioned

"Inverting" Rank Deficient Matrices

- ullet Rank deficient matrices are non-invertible (i.e. we don't know the vector x such that Mx=b) as we don't know the component of the x in the null spacel
- ullet Although we don't know x we can find a vector, x, that satisfies $\mathbf{M}x=b\mathbf{I}$
- Given a symmetric $n \times n$ matrix with k non-zero eigenvalues λ_1 , λ_2 , ..., λ_k we can construct a "pseudo inverse" \mathbf{M}^+ as $\mathbf{V}\mathbf{\Lambda}^+\mathbf{V}^\mathsf{T}$ where $\mathbf{\Lambda}^+ = \mathrm{diag}(\frac{1}{\lambda_1}, \frac{1}{\lambda_2}, \ldots, \frac{1}{\lambda_k}, 0, \ldots, 0)$
- This finds the vector x with no component in the null space (it is the solution with the smallest norm)
- This is a different to the pseudo inverse for non-square matrices

Rank of a Matrix

- ullet The rank of a matrix, M, is the number of non-zero eigenvalues
- The space spanned by the eigenvectors v_a , v_b , etc. with zero eigenvalue forms a **null space!**
- Any vector in the null space will get projected to the zero vector

$$\mathbf{M}(a\mathbf{v}_a + b\mathbf{v}_b + \cdots) = \mathbf{0}$$

- A square matrix is said to be **rank deficient** if it has any eigenvectors with eigenvalue equal to 0
- This happens when the columns of the matrix are not linearly independent

Adam Prügel-Bennett

COMP6208 Advanced Machine Learning

Low Rank Approximation

- Recall that matrices with large and small eigenvectors are ill-conditions so the inverse has the potential to greatly amplify any measurement error!
- One work around is to set all small eigenvalues to zero and use the pseudo inverse!
- Setting small eigenvalues to zero reduces the rank of the matrix and is an example of a low rank approximation!
- Low rank approximations are much used to obtain approximate models for arrays of data (we will revisit this when we look at SVD)

Adam Prügel-Bennett

COMP6208 Advanced Machine Learning

Summary

- Linear mappings are commonly used in machine learning algorithms such as regression!
- We can understand symmetric operators by looking at their eigenvectors
- ullet Any symmetric matrix can be decomposed as $M = V \Lambda V^{\text{T}}$
 - \star where V are orthogonal matrices whose rows are the eigenvector
 - \star and Λ is a diagonal matrix of the eigenvalues
- This decomposition allows us to understand inverse mappings
