Spread of Data

• Often data varies significantly in only some directions

 Reduce dimensions by projecting onto low dimensional subspace with maximum variation

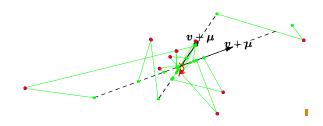

Adam Prügel-Bennett

COMP6208 Advanced Machine Learnin

https://ecs-vlc.github.io/comp6208/

Dimensionality Reduction

- Often helpful to consider only directions where data varies significantly
- Want to find directions along which data has its greatest variation

Adam Prügel-Bennett

COMP6208 Advanced Machine Learnin

https://ecs-vlc.github.io/comp6208

Direction of Maximum Variation

• Expanding the Lagrangian

$$\begin{split} \mathcal{L} &= \frac{1}{m-1} \sum_{k=1}^m \left(\boldsymbol{v}^\mathsf{T} (\boldsymbol{x}_k - \boldsymbol{\mu}) \right)^2 - \lambda \left(\|\boldsymbol{v}\|^2 - 1 \right) \mathbb{I} \\ &= \frac{1}{m-1} \sum_{k=1}^m \left(\boldsymbol{v}^\mathsf{T} (\boldsymbol{x}_k - \boldsymbol{\mu}) (\boldsymbol{x}_k - \boldsymbol{\mu})^\mathsf{T} \boldsymbol{v} \right) - \lambda \left(\|\boldsymbol{v}\|^2 - 1 \right) \mathbb{I} \\ &= \boldsymbol{v}^\mathsf{T} \left(\frac{1}{m-1} \sum_{k=1}^m (\boldsymbol{x}_k - \boldsymbol{\mu}) (\boldsymbol{x}_k - \boldsymbol{\mu})^\mathsf{T} \right) \boldsymbol{v} - \lambda \left(\|\boldsymbol{v}\|^2 - 1 \right) \mathbb{I} \\ &= \boldsymbol{v}^\mathsf{T} \mathbf{C} \boldsymbol{v} - \lambda \left(\boldsymbol{v}^\mathsf{T} \boldsymbol{v} - 1 \right) \mathbb{I} \end{split}$$

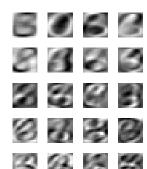

• Extrema of the Lagrangian

$$\nabla \mathcal{L} = 2(\mathbf{C}\mathbf{v} - \lambda \mathbf{v}) = 0$$
 \Rightarrow $\mathbf{C}\mathbf{v} = \lambda \mathbf{v}$

Looking is not Enough

Can't spot low dimensional data by looking at numbers

Adam Prügel-Bennet

OMP6208 Advanced Machine Learning

https://ecs-vlc.github.io/comp6208/

Direction of Maximum Variation

ullet Look for the vector $oldsymbol{v}$ with $\|oldsymbol{v}\|^2=1$ to maximise

$$\sigma^2 = rac{1}{m-1} {\sum_{i=1}^m} ig(oldsymbol{v}^\mathsf{T} (oldsymbol{x}_i - oldsymbol{\mu}) ig)^2 lacksquare$$

- This is a constrained optimisation problem
- Solve by maximising Lagrangian

$$\mathcal{L} = \frac{1}{m-1} \sum_{k=1}^{m} \left(\boldsymbol{v}^\mathsf{T} (\boldsymbol{x}_k - \boldsymbol{\mu}) \right)^2 - \lambda \left(\|\boldsymbol{v}\|^2 - 1 \right)$$

ullet λ is a Lagrange multiplier

Adam Prügel-Bennett

COMP6208 Advanced Machine Learni

https://ecs-vlc.github.io/comp6208/

Direction of Maximum Variation

• The eigenvectors are directions that are extrema of the variance

ullet The variance in direction v is equal to

$$\sigma^2 = rac{1}{m-1} \sum_{i=1}^m \left(oldsymbol{v}^\mathsf{T} (oldsymbol{x}_i - oldsymbol{\mu})
ight)^2 oldsymbol{\mathbb{I}}$$
 $= oldsymbol{v}^\mathsf{T} oldsymbol{V} = \lambda oldsymbol{v}^\mathsf{T} oldsymbol{v} = \lambda oldsymbol{\mathbb{I}}$

• The variance is maximised by the eigenvector with the maximum eigenvalue

Covariance Matrix

• The covariance matrix is defined as

$$\mathbf{C} = \frac{1}{m-1} \sum_{k=1}^{m} \left(oldsymbol{x}_k - oldsymbol{\mu}
ight) \left(oldsymbol{x}_k - oldsymbol{\mu}
ight)^\mathsf{T}$$

• The components C_{ij} measure how the i^{th} and j^{th} components co-vary

$$C_{ij} = \frac{1}{m-1} \sum_{k=1}^{m} (x_{ik} - \mu_i) (x_{jk} - \mu_j)$$

• C.f. covariance of random variables

$$Cov(X,Y) = \mathbb{E}[(X - \mathbb{E}[X])(Y - \mathbb{E}[Y])]$$

Adam Prügel-Bennet

COMP6208 Advanced Machine Learn

https://ecs-vlc.github.io/comp6208/

Matrix Form

• The covariance matrix is

$$\mathbf{C} = \frac{1}{m-1} \sum_{k=1}^{m} (\mathbf{x}_k - \boldsymbol{\mu}) (\mathbf{x}_k - \boldsymbol{\mu})^{\mathsf{T}}$$

• Define the matrix

$$\mathbf{X} = \frac{1}{\sqrt{m-1}} (\mathbf{x}_1 - \boldsymbol{\mu}, \mathbf{x}_2 - \boldsymbol{\mu}, \cdots \mathbf{x}_m - \boldsymbol{\mu})$$

• We can write the covariance matrix as

$$C = XX^T$$

Adam Prügel-Benne

COMP6208 Advanced Machine Learni

https://ecs-vlc.github.io/comp6208/

Eigenvalue Decomposition

- ullet The eigenvectors of C with the largest eigenvalues are known as the **principal components**
- The eigenvalues are all greater than or equal to zerol
- ullet Recall an eigenvector v satisfies the equation

$$\mathbf{C}\mathbf{v} = \lambda \mathbf{v}$$

ullet Multiplying both sides by $v^{ extsf{T}}$

$$\boldsymbol{v}^{\mathsf{T}} \mathbf{C} \boldsymbol{v} = \lambda \boldsymbol{v}^{\mathsf{T}} \boldsymbol{v} = \lambda \| \boldsymbol{v} \|^2$$

but $\boldsymbol{v}^\mathsf{T} \mathbf{C} \boldsymbol{v} \geq 0$ and $\|\boldsymbol{v}\|^2 > 0$ so

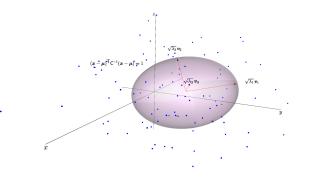

$$\lambda = \frac{\boldsymbol{v}^\mathsf{T} \mathbf{C} \boldsymbol{v}}{\|\boldsymbol{v}\|^2} \ge 0$$

Ellipsoid and Eigen Space

Outer Product

• Remember that the outer-product of two vectors is defined as

• C.f. Inner product

Adam Prügel-Bennett

COMP6208 Advanced Machine Learning

https://ecs-vlc.github.io/comp6208/

Properties of Covariance Matrix

• The quadratic form of a vector and matrix is defined as

$$v^{\mathsf{T}} M v$$

 The quadratic form of a covariance matrix is non-negative for any vector

$$\boldsymbol{v}^\mathsf{T} \mathbf{C} \boldsymbol{v} |\!|\!= \boldsymbol{v}^\mathsf{T} \mathbf{X} \mathbf{X}^\mathsf{T} \boldsymbol{v} |\!|\!= \boldsymbol{u}^\mathsf{T} \boldsymbol{u} = \|\boldsymbol{u}\|^2 \geq 0$$
 where $\boldsymbol{u} = \mathbf{X}^\mathsf{T} \boldsymbol{v} |\!|$

 Matrices with non-negative quadratic forms are known as positive semi-definite!

Adam Prügel-Bennett

COMP6208 Advanced Machine Learnin

https://ecs-vlc.github.io/comp6208/

Surface Defined by Matrix

ullet The set of vectors x such that

$$\boldsymbol{x}^\mathsf{T} \mathbf{C}^{-1} \boldsymbol{x} = 1$$

defines a surface

- ullet The surface is an ellipsoid, \mathcal{E}
- The eigenvectors point in the direction of the principal axes of the ellipsoid
- The radii of the principal axes are equal to the square root of the eigenvalues

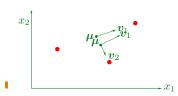

Adam Prügel-Bennett

COMP6208 Advanced Machine Learnin

https://ecs-vlc.github.io/comp6208/ 14

Spanning Input Space

- A covariance matrix will have a zero eigenvalue only if there is no variation in the direction of the corresponding eigenvector
- A covariance matrix will have zero eigenvalues if the number of patterns are less than or equal to the number of dimensions
- ullet A covariance matrix formed from p+1 patterns that are linearly independent (i.e. you cannot form any one out of p of the other patterns) will have no zero eigenvalues

Positive Definite Outline

Matrices with no zero eigenvalues are called full rank matrices
 (as opposed to rank deficient)

• Full rank matrices are invertible, rank deficient matrices are singular and non-invertible

 Full rank covariance matrices have positive eigenvalues only and are said to be positive definite!

 \bullet We would expect that when m>p the covariance matrix will be positive definite unless there are some symmetries that linearly constrain the patterns

Adam Prügel-Bennett COMP6208 Advanced Machine Learning https://ecs-vlc.github.io/comp6208/

Principal Component Analysis

- PCA occurs as follows
 - ★ Construct the covariance matrix
 - ★ Find the eigenvalues and eigenvectors
 - ★ Keep the eigenvectors with the largest eigenvalues (principal components)
 - ⋆ Project the inputs into the space spanned by the principal components ■
- We then use the projected inputs as inputs to our learning machinel

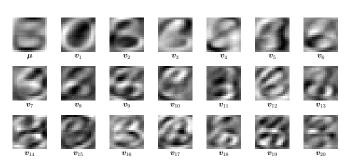

Adam Prügel-Bennett COMP6208 Advanced Machine Learning https://ecs-vlc.github.io/comp6208/

Subspace Projection

 $\mu_1 \cdots \nu_1$ ν_2

Eigenvectors

1. Covariance Matrices

2. Principal Component Analysis

3. Duality

Adam Prügel-Bennett

COMP6208 Advanced Machine Learnin

https://ecs-vlc.github.io/comp6208/

Projection Matrix

• To project the inputs construct the projection matrix

$$\mathbf{P} = egin{pmatrix} oldsymbol{v}_1^\mathsf{T} \ oldsymbol{v}_2^\mathsf{T} \ dots \ oldsymbol{v}_k^\mathsf{T} \end{pmatrix}$$

- ullet k < p is the number of principal components we keep
- ullet Given a p-dimensional input pattern $oldsymbol{x}$ we can construct a k-dimensional representation $oldsymbol{z}$

$$z = P(x - \mu)$$

Use z as our new inputs

Adam Prügel-Bennett COMP6208 Advanced Machine

https://ecs-vlc.github.io/comp6208/

Hand Written Digits

Adam Prügel-Bennett

COMP6208 Advanced Machine Learning

https://ecs-vlc.github.io/comp6208/

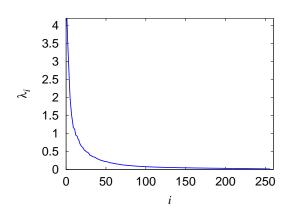

Reconstruction

 Projecting into a subspace of eigenvectors can be seen as approximating the inputs by

$$\hat{oldsymbol{x}}_i = oldsymbol{\mu} + \sum_{j=1}^k z_j^i oldsymbol{v}_j, \qquad z_j^i = oldsymbol{v}_j^\mathsf{T} (oldsymbol{x}_i - oldsymbol{\mu}), \qquad \|oldsymbol{v}_j\| = 1$$

- Principle component analysis projects the data into a subspace of size m with the minimal approximation error $\mathbb{E} \big[\|\hat{x}_i x_i\|^2 \big]$
- The loss of "energy" (or squared error) is equal to the sum of the eigenvalues in the directions that are ignored

Eigenvalues for Digits

- 3. Duality

Adam Prügel-Bennett

COMP6208 Advanced Machine Learnin

https://ecs-vlc.github.io/comp6208/

Dual Matrix

- ullet The covariance ${f C} = {f X} {f X}^{\sf T}$ is a p imes p matrix
- Consider the $m \times m$ matrix $\mathbf{D} = \mathbf{X}^\mathsf{T} \mathbf{X}$
- ullet Suppose v is an eigenvector of D

$$egin{aligned} \mathbf{D} oldsymbol{v} &= \lambda oldsymbol{v} oldsymbol{I} \ \mathbf{X} oldsymbol{X} \mathbf{X} oldsymbol{v} &= \lambda oldsymbol{X} oldsymbol{v} oldsymbol{I} \ \mathbf{C} \mathbf{X} oldsymbol{v} &= \lambda oldsymbol{X} oldsymbol{v} oldsymbol{I} \ \mathbf{C} \mathbf{X} oldsymbol{v} &= \lambda oldsymbol{X} oldsymbol{v} oldsymbol{I} \ \end{pmatrix} \quad oldsymbol{C} oldsymbol{u} &= \lambda oldsymbol{u} \ \end{pmatrix}$$

 $ullet \ u = \mathbf{X} v \mathbf{U} (ext{and} \ v \propto \mathbf{X}^{\mathsf{T}} u) \mathbf{U}$

Adam Prügel-Bennett

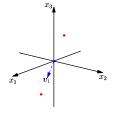

COMP6208 Advanced Machine Learnin

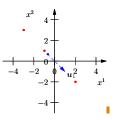

https://ecs-vlc.github.io/comp6208/

What Does a Subspace Look Like?

- ullet Consider $m{y}^1=\left(egin{array}{c}2\\4\\4\end{array}
 ight),\,m{y}^2=\left(egin{array}{c}8\\6\\2\end{array}
 ight)$ with mean $m{\mu}=\left(egin{array}{c}5\\5\\3\end{array}
 ight)$
- ullet Subtracting the mean $x^i=y^i-\mu$ we can construct matrix

$$\mathbf{X} = \begin{pmatrix} x_1^1 & x_1^2 \\ x_2^1 & x_2^2 \\ x_3^1 & x_3^2 \end{pmatrix} = \begin{pmatrix} -3 & 3 \\ -1 & 1 \\ 2 & -2 \end{pmatrix}$$

Adam Prügel-Bennett

COMP6208 Advanced Machine Learning

https://ecs-vlc.github.io/comp6208/

PCA for Images

- An image often contains around $p = 256 \times 256 = 64k$ pixels
- \bullet In standard PCA we would create an $p\times p$ matrix with over 4×10^9 elements!
- This is intractable
- ullet m images span at most a m-1 dimensional subspace
- Usually this subspace will be much smaller than the space of all images $m \ll p^{\rm II}$

Adam Prügel-Ben

COMP6208 Advanced Machine Learn

https://ecs-vlc.github.io/comp6208/

ullet Matrices $C = XX^{\mathsf{T}}$ and $D = X^{\mathsf{T}}X$ have the same eigenvalues

Dual Matrix

- \bullet Can use the dual $m\times m$ matrix ${\bf D}$ to find eigenvalues and eigenvectors of ${\bf Cl}$
- ullet Note that $\mathbf{D} = \mathbf{X}^\mathsf{T} \mathbf{X}$ has components $D_{kl} \propto (oldsymbol{x}_k oldsymbol{\mu})^\mathsf{T} (oldsymbol{x}_l oldsymbol{\mu})^\mathsf{T}$
- Takes $O(p \times m \times m)$ time to construct \mathbf{D}
- We work in a "dual space" which is the space spanned by the examples

Adam Prügel-Bennett

COMP6208 Advanced Machine Lear

https://ecs-vlc.github.io/comp6208/

Summary

- PCA allows us to reduce the dimensionality of the inputs
- We project the inputs into a sub-space where the data varies the most!
- We can work in either the original space (XX^T) or the dual space (X^TX)
- When we have many more features than examples (i.e. $p\gg m$) then it is more efficient working in the dual space!
- We will see examples of dual spaces again when we look at SVMs
